

Repair of Transformers

Restoring the right voltage to your machinery

Transformers are a critical element in the power supply chain. Their functional reliability and high availability are essential. Baumüller provides swift and competent support during the mechanical and electrical repair of your transformers.

Our qualified staff, with many years of experience, as well as the test systems used, ensure a systematic, professional diagnosis and as good as new refurbishment of your transformers. The basis for our services are the applicable DIN, VDI and VDE regulations.

Whether they are oil transformers, dry transformers or cast resin transformers, we recondition your transformer as good as new, thereby ensure it's long-term use. On request we assume the complete project responsibility – from dismantling, through transport logistics and repair, to installation and recommissioning.

**Extended lifecycle
due to as good as
new reconditioning**

Repair of Transformers

Comprehensive services – also on site

Our services range from a comprehensive mechanical and electrical inspection on receipt, to re-winding of the coils and repair of the winding core. Further latent damages can be identified with the help of thermographic analysis. Oil analyses are undertaken in an independent specialist laboratory and the oil then suitably conditioned or professionally disposed of.

As part of a service partnership, our service engineers undertake regular on-site inspections on cable terminations and earthing systems. If necessary, sealing work and transformer cleaning is undertaken. Regular maintenance of your transformers extends the overhaul intervals and reduces the probability of a failure.

**Our objective is your benefit:
The increased reliability and
availability of your transformers**

Your benefits

- © As good as new reconditioning increases the reliability and extends the service life of your transformers
- © Simplified order processing due to complete implementation by a single competent partner – from dismantling and reconditioning through to recommissioning – service from a single source
- © The regular maintenance of your transformers extends the overhaul intervals and the availability of your machine is increased
- © All inspections and work steps are undertaken and documented in accordance with the applicable standards
